

CASE 2

15 Y/O BOY

Brief history

- **Past history**

Denied

- **Chief complain**

Recurrent right facial palsy and right upper limbs weakness for one day

Imaging studies

Brain CT (no C) (2018.05.12)

Brain MRI (+ C) (2018.05.14)

Imaging findings

- ✓ CT :
Equivocal density of splenium (corpus callosum)
- ✓ MRI :
Symmetrical and bilateral hyperintensity changes in bilateral motor tracts, splenium of the corpus callosum and parietal white matter

Imaging findings

Differential Diagnoses

- Hypoglycemia
- Acute disseminated encephalomyelitis (ADEM)
- HSV encephalitis

Other findings

- ✓ Lumbar puncture: normal
- ✓ Plain film: **Pec cavus**
- ✓ Neurological conductive study :
 - **diffusely demyelinating sensorimotor polyneuropathy**
 - **sudomotor dysfunction** in lower limbs
 - **Peripheral neuropathy** in somatosensory evoke potential

Differential Diagnoses

- Hypoglycemia
- Acute disseminated encephalomyelitis (ADEM)
- HSV encephalitis
- **X-linked Charcot-Marie-Tooth disease (CMTX1)**

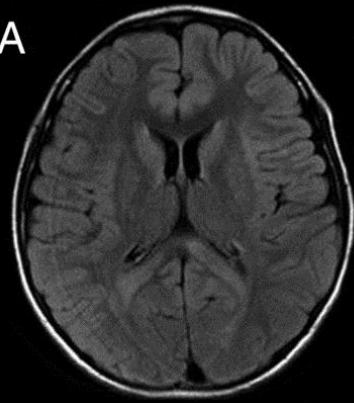

X-linked Charcot-Marie-Tooth disease

- X-linked CMT (CMTX), CMTX type 1 (CMTX1)
- **Heterogeneous hereditary peripheral sensory and motor neuropathy**; 2nd most common CMT variant after CMT1A
- Mutations in **gap junction beta 1 gene (GJB1)** on chromosome Xq13.1 coding for **connexin-32**
- **Acute transient encephalopathy**
- **Transient motor weakness**
- **Chronic distal leg muscle wasting ± weakness of ankle flexion**
- **Pes cavus foot deformity**

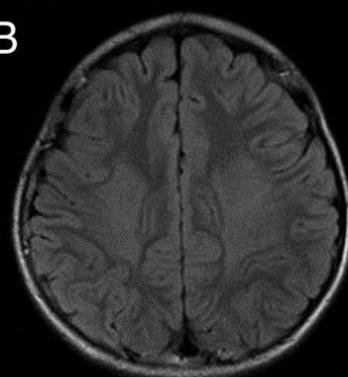

X-linked Charcot-Marie-Tooth disease

- NECT :
lesions normal (undetectable) to **slightly hypodense**
- MRI :
 - **confluent symmetric white matter T2-hyperintense lesions** in posterior centrum semiovale, splenium
 - acute lesions show **diffusion restriction**
 - spares subcortical U-fibers
 - **no lesion enhancement**
- White matter lesions transient; improvement or complete resolution common
